The Radioactive Springs of Rumania (Radioaktivnyye istochniki

Rumynii)

PERIODICAL:

Priroda, 1958, Nr 4, pp 85-87 (USSR)

ABSTRACT:

The author gives a survey of the Rumanian health resorts known for their radioactive springs. The first springs of this kind were discovered by Professor Dragomir Khurmuzesku during the period 1904 - 1910. After World War II, Rumanian scientists of Glanec-Moldava, Clui and Iasi universities started to systematically investigate the therapeutic properties of these spas. Baile Herculane, Singureni, Valea Vinului, Beile Borsa, Borsec are the best known health resorts whose radioactive springs favorably affect the glands of inner secretion, the nervous system and increase the number of red blood corpuscles in the human body. Their radioactivity varies between 4.5 and 21 MMC . According to the authors, radioactive springs have also been found in many other parts of Rumania which, so far, have not been

Card 1/2

exploited.

Issledovaniye i proyektirovaniye elektromagnitnykh sredstv peremeshcheniya zhidkikh metallow (Investigation and design of electromagnetic means for the transfer of liquid metals); sbornik trudov, no. 3, 33-39 TOPIC TAGS: electromagnetic field, magnetic induction, liquid metal pump 11. ABSTRACT: By their construction, induction channels differ from electromagnetic pumps in the following ways: 1) since in an induction channel the upper ferromagnetic core is not present, the electromagnetic field extends to infinity, but is damped out quickly over the height; 2) the metal has a free surface, and the thickness of the layer of metal and the rate of movement of the metal at every point of the channel are determined by the effect of electromagnetic, gravitational, and hydrodynamic forces. In a way analogous to that previously used for an induction pump the author sets up equations for the total power and the electromagnetic force of induction channels. The equations arrived at are checked against experimental data with satisfactory results. Orig. art. has: 8 formulas and 4 figures. SUBJCOFF: 2011 SUBM DATE: none/ ORIG REF: 008

TITLE:

Corrosion Resistance of "22K"-Steel Weld Joints (Kerrozion-

naya stoykost; svarnykh soyedineniy stali 22 K)

PERIODICAL:

Avtomaticheskaya svarka, 1958, Nr 3, pp 33-41 (USSR)

ABSTRACT:

Both Soviet and foreign scientists, such as G.V. Akimov, B.M. Parking, V.N. Noyev, N.D. Sobolev and L.A. Glikman, have been concerned with the problem of cracks in boilers for some time. The Electric Welding Institute imeni Paton carried out corrosion tests of electric-slag and multilayer welded "22K"-steel specimens, put into a solution of nitrate salts $(45\% \text{ Ca } (\text{NO}_3)_2 \text{ and } 35\% \text{ NH}_4 \text{NO}_3 \text{ plus water})$, which was recommended by Zemon and had been successfully used by S.G. Vedenkin. The authors come to the conclusion that electric-slag welded joints have a higher resistance to caustic brittleness than multilayer welded joints. Seam cracks have a crystallite character and occur near the fusion line. Measurements of electrode potential of weld surfaces, showed that the potential is distributed uniformly in electric-slag welded joints, but drops sharply in the zone of thermal influence in joints made by automatic multilayer welding.

TITLE:

Corrosion Resistance of "IKhleN9T"-Steel Weld Joints in Nitric Acid Production (Korrozionnaya stoykost' svarnykh soyedineniy iz stali lKhl0N9T v usloviyakh proizvodstva

PERIODICAL:

Avtomaticheskaya svarka, 1958, Nr 9, pp 61-73 (USSR)

ABSTRACT.

Application of "IKhl8N9T" steel for equipment used in the production of nitric acid requires welding processes producing joints that are resistant against corrosion and intercrystalline corrosion and which is similar to that cf the base metal. For this purpose, natural corrosion tests of "1Kh18N9T" steel specimens welded with different electrodes under flux were carried out at the Chemical Combine imeni Stalin at Dimitrovgrad (Bulgaria). It was proved that seams welded with chromo-nickel-vanadium-niobium rods (OKhlen9FBS -E1649) and chromo-nickel-vanadium rods (OKh18N9F2S - E1606), have high corrosion and intercrystalline corrosion resistance under conditions of nitric acid production and that cold hardening by stretching, as well as by compression, increases

TITLE: Experimental regional seismic observations in the western part of the North Caspian petroliferous basin

SOURCE: Ref. zh. Geofiz, Abs. 3D150

REF SOURCE: Tr. Nizhne-Volzhsk. n.-i. in-t geol. i geofiz., vyp. 2, 1964, 170-178

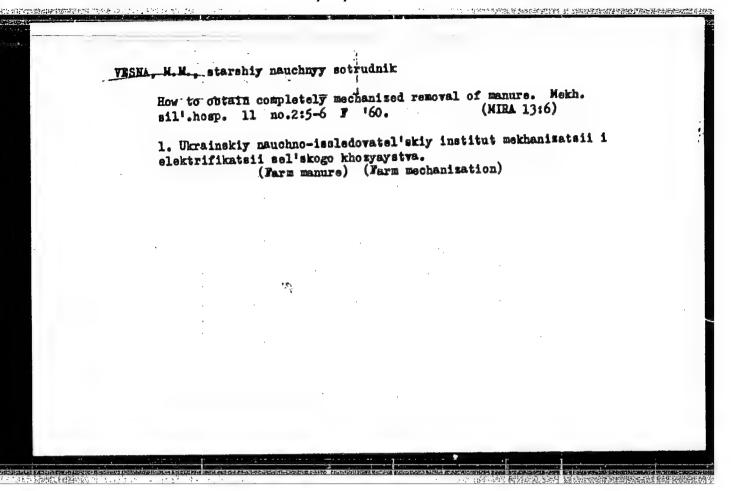

TOPIC TAGS: seismic prospecting, geologic exploration

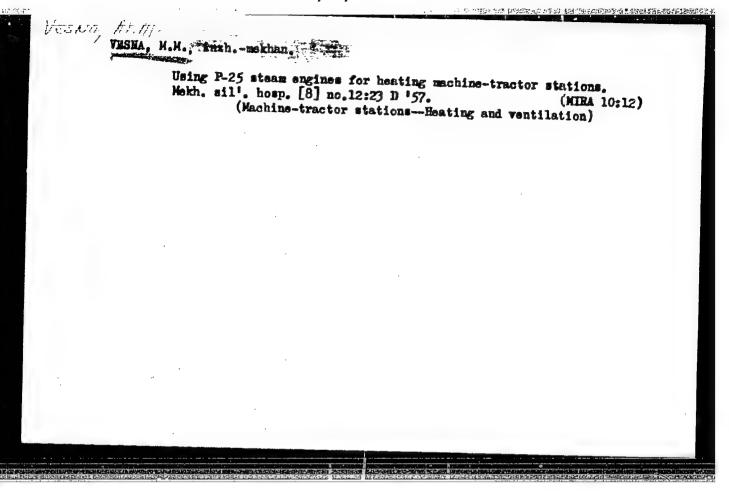

TRANSLATION: The paper describes the results of a field work in an area where the Voronezh massif of the Russian Platform adjoins the Caspian Basin. Two seismic profiles were run, totalling 140 to 150 km. The KMPV method was mostly used, although some work was done by the MOV and even RNP methods. The profiling was continuous when using the KMPV method. The wave reflected from the basement top was traced through the entire lengths of the profiles, since this basement was the main object of investigation. It was recorded as first "kicks" at distances of 9 to 35 km from the primary wave. Its apparent velocity varied between 5800 and 6300 m/sec. Its coefficient of dampening was 1.7·10⁻⁵ 1/M. The superimposing traces lacked a parallelism. This wave was identical with the refracted one. In the western part of the area, some reflec-
